1#  The script that I will implement on my main page will be a dark mode selector. This will change the contrast of
the background to a darker theme. This will make the contrast better for some people.

2.This script will enhance accessibility and make the contrast easier to read for some as well as reducing eye
strain and glare, especially in low light conditions.

3. first I will create the CSS styling for the dark theme, then I will use the DOM methods to make a element that
applies these changes. Then I will make a button in html were the user will click to make these changes.

4.
